Homework 04 - ASP.NET Core MVC

11th October, 2025 – Professor Shuja Ur Rehman Baig

Important Instructions:

- Any instance of cheating or plagiarism will result in a **F grade**.
- Deadline: 14th October, 2025 11:59 PM

Objective

This homework will help you understand:

- How the **MVC layers (Model, View, Controller)** interact
- How to use **HTML forms with Razor syntax**
- How to handle **GET and POST requests** in controllers
- How to **store and retrieve data from a SQL database** using **ADO.NET**

Task: Build a Simple Feedback Form with Database

Create a small **ASP.NET Core MVC application** where a user can submit feedback, the app saves it in a **SQL database**, and displays it back on another page.

Requirements

1. Database Setup

Create a SQL table to store feedback:

```
CREATE TABLE Feedbacks
(
    Id INT IDENTITY(1,1) PRIMARY KEY,
    StudentName NVARCHAR(100) NOT NULL,
    Course NVARCHAR(100) NOT NULL,
    Comments NVARCHAR(MAX),
    Rating INT NOT NULL,
    DateSubmitted DATETIME NOT NULL
);
```

2. Model Layer

Create a class named **Feedback** in the **Models** folder:

```
public class Feedback
{
    public int Id { get; set; } // Database ID
    public string StudentName { get; set; }
    public string Course { get; set; }
    public string Comments { get; set; }
    public int Rating { get; set; }
    public readonly DateTime DateSubmitted = DateTime.Now;
}
```

3. Controller Layer

Create a controller named **FeedbackController** with these actions:

1. **[HttpGet] Index()**
 - Displays a welcome page with a link/button to open the feedback form.
 2. **[HttpGet] GiveFeedback()**
 - Displays the feedback form.
 3. **[HttpPost] GiveFeedback(Feedback feedback)**
 - Receives form data.
 - Saves it to the **SQL database using ADO.NET**.
 - Redirects to **FeedbackSummary** using **RedirectToAction**.
 4. **[HttpGet] FeedbackSummary(Feedback feedback)**
 - Displays the submitted feedback using a **GET method**.
 5. **[HttpGet] AllFeedbacks()**
 - Displays **all feedback entries** from the database.
-

4. View Layer

1. **Index.cshtml** – Welcome page with links to the form and all feedbacks.
2. **GiveFeedback.cshtml** – HTML form for input (StudentName, Course, Comments, Rating).
3. **FeedbackSummary.cshtml** – Shows the submitted feedback.
4. **AllFeedbacks.cshtml** – Displays all feedbacks in a table.
